At Risk for Heart Disease or Stroke?

Help us find potential new ways to lower the risk of heart disease, stroke and peripheral vascular disease.

We are conducting a research study to determine whether a new investigational medicine, which raises HDL and lowers LDL cholesterol, will also lower the risk of future cardiac events and strokes.

The study, which is being conducted at clinical research centers world wide, is open to men and women age 50 and older who have suffered a stroke, heart attack, or peripheral arterial disease that has been repaired.

Screening procedures are at no cost and if you qualify for the study you will receive:

- 1) Lipitor as a part of the study at no cost.
- 2) You will receive all study related laboratory tests as well as the study medication at no cost.
- 3) Patients will also receive a stipend for travel expenses.
